

CS311 Project2 Report

A report should at least include the following sections. The order given here is suggested but optional. You can re-organize it as long as the expected information is presented.

Subtask 1

1. Introduction

1. Give a general introduction to the subtask 1.
2. State the purpose of this subtask.

2. Methodology

1. Algorithm/model design.
 - Describe the baseline(or your own) algorithm/model with pseudo-code/flow charts/diagrams.
 - **DO NOT paste (edited) Python code.**
2. Analysis. Discuss, for example, the optimality and complexity of the algorithm, and what is the deciding factor of its performance.

3. Experiments

1. Metrics: how to measure your performance
2. Your Experimental results:
3. Try to find through the experiments:
 - the effect of different models (if any)
 - the effect of hyperparameters (if any), e.g., the learning rate.
 - Analyze the effect of different models and hyperparameters if you have corresponding experiments.

4. Further thoughts

Further thoughts on how it can be improved if you have enough time.

Subtask 2

1. Introduction

1. Give a general introduction to the subtask 2.
2. State the purpose of this subtask.

2. Methodology

1. Algorithm/model design.
 - Describe which algorithm/model used in the baseline(or your own) algorithm/model with pseudo-

code/flow charts/diagrams.

- **DO NOT paste (edited) Python code.**

2. Analysis. Discuss, for example, the optimality and complexity of the algorithm, and what is the deciding factor of its performance.

3. Experiments

1. Metrics: how to measure your performance
2. Your Experimental results:
3. Try to find through the experiments:
 - the effect of different models (if any) or the similarity metric
 - the effect of hyperparameters (if any).
 - Analyze the effect of different models and hyperparameters if you have corresponding experiments.

4. Further thoughts

Further thoughts on how it can be improved if you have enough time.

Subtask 3

1. Introduction

1. Give a general introduction to the subtask 3.
2. State the purpose of this subtask.

2. Methodology

1. Problem representation.
2. Algorithm/model design.
 - Describe which algorithm/model used in the baseline(or your own) algorithm/model with pseudo-code/flow charts/diagrams.
 - **DO NOT paste (edited) Python code.**
3. Analysis. Discuss, for example, the optimality and complexity of the algorithm, and what is the deciding factor of its performance.

3. Experiments

1. Metrics: how to measure your performance, describe the test flow.
2. Your Experimental results:
3. Try to find through the experiments:
 - the effect of different models (if any) or algorithms
 - the effect of hyperparameters (if any).
 - Analyze the effect of different algorithms/models and hyperparameters if you have corresponding experiments.

4. Further thoughts

Further thoughts on how it can be improved if you have enough time.
